MySQL.com is using Oracle SSO for authentication. If you already have an Oracle Web account, click the Login link. Otherwise, you can sign up for a free account by clicking the Sign Up link and following the instructions.

No thanks, just start my download.

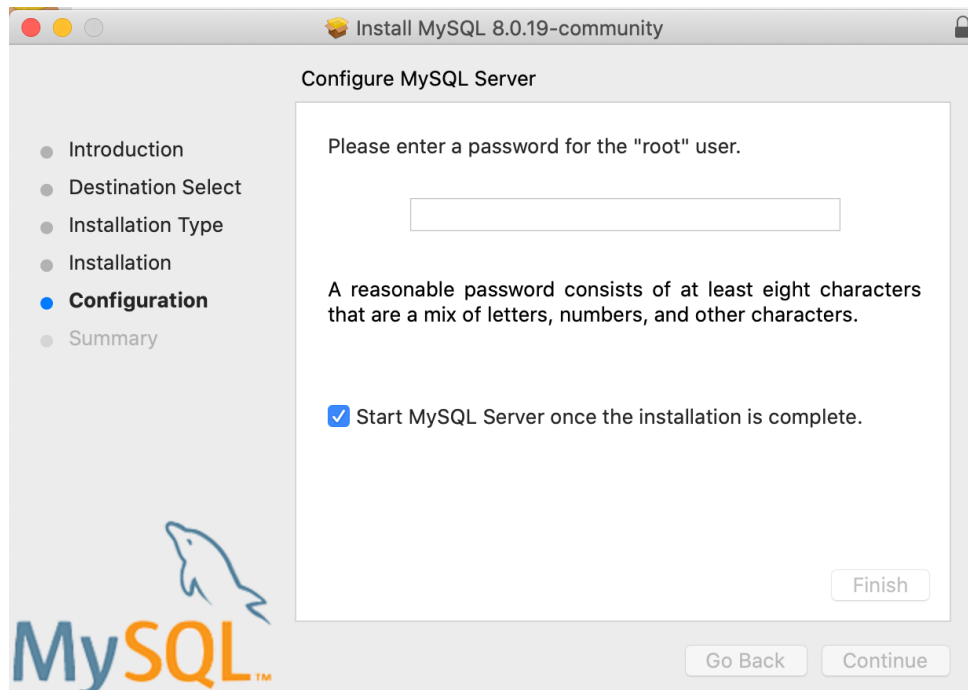

Open the file that downloads and open (double click) the package file.

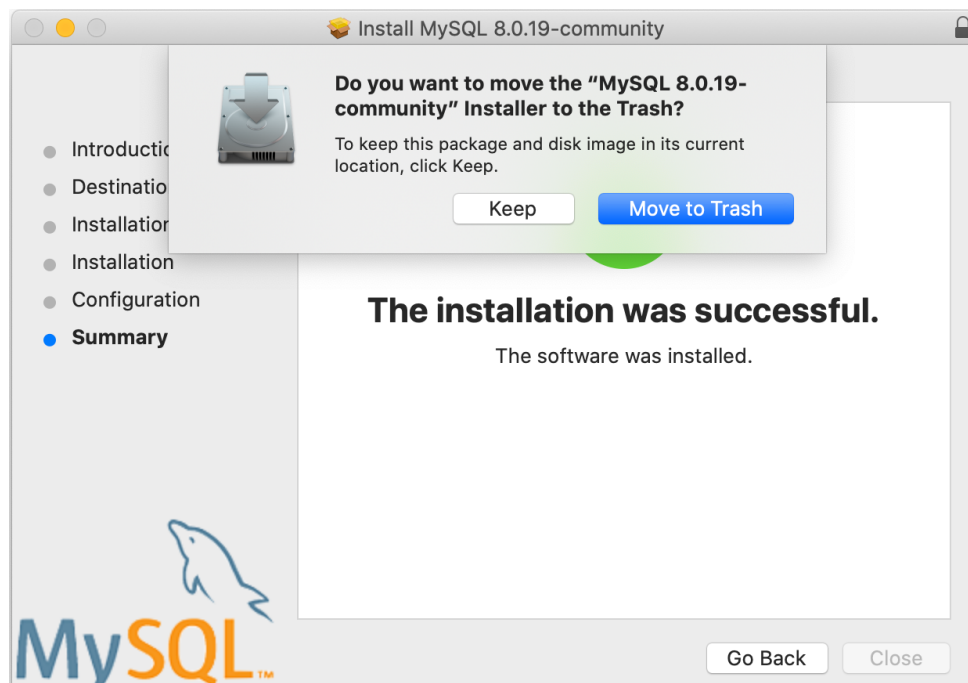

Click Continue and Continue

Go through the install wizard with all defaults.

When you are asked to enter a password for the “root” user, pick an easy to remember password. If you forget this password and get locked out of your local server, it is a huge process to unlock it. So, don’t forget your password here. It can just be ‘password’ if you want. This won’t be a real industry server that has to be secure.

After it installs it asks if you want to move the install file to the trash. I usually do, but it doesn’t matter either way. We are done with that file, now that it’s installed.

Go to your Mac System Preferences and make sure the MySQL icon is there.

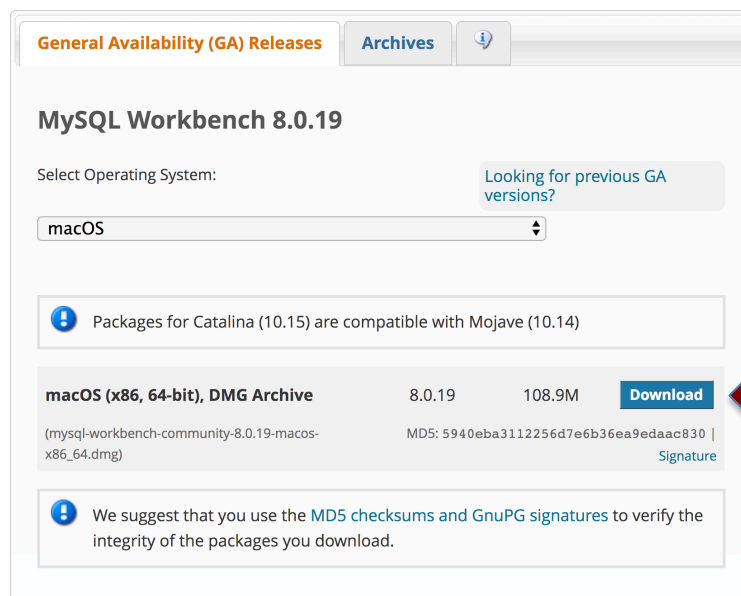

2. Install MySQL Workbench:

Go to:

<https://dev.mysql.com/downloads/workbench/>

NOTE: version numbers you see may be different than those below in the images. Just download the latest version

2. Click download

Click “No thanks, just start my download”

[No thanks, just start my download.](#)

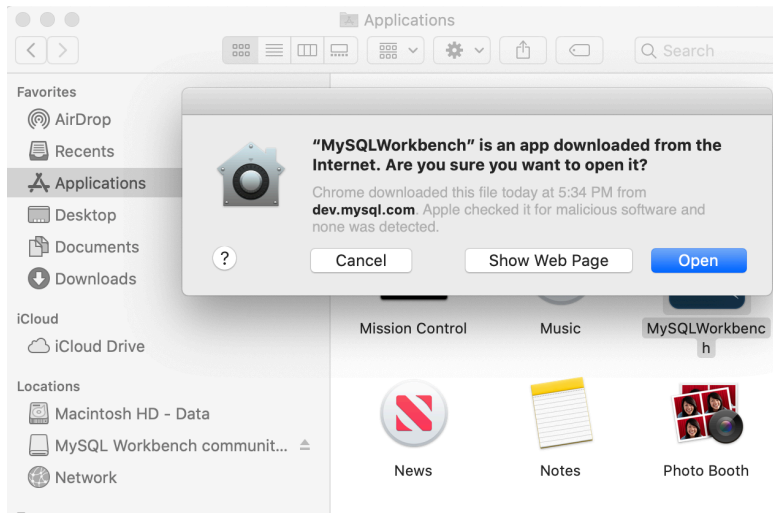

Open the file that downloads (The file will have the words “workbench-community” in it”). Drag the program icon to your application folder icon.

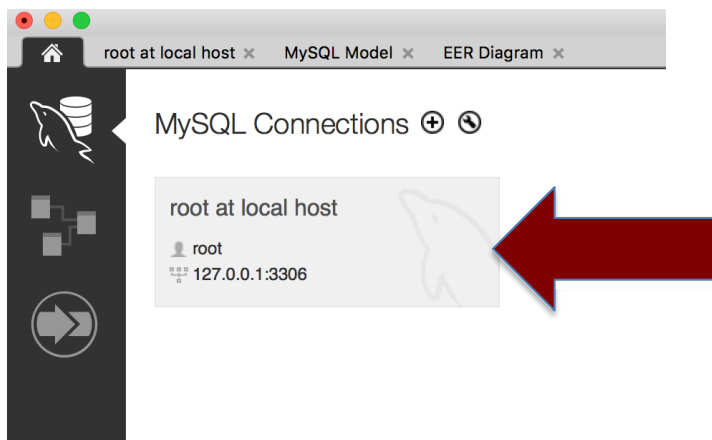

You should now see MySQL Workbench in your applications.

Click Open, we trust it.

Once you open Workbench you should see a local server instance, something like this:

If you don't see the local server instance, look for a link that says "Rescan Servers", click it and it should be available to you.

If you should ever need to stop the server from running. Go to your System Preferences and click the MySQL logo and 'Stop MySQL Server'. But I would just allow it to continue to run. You need it running for Workbench to work properly.

Congrats you have it all installed!

A few more issues to be aware of:

If you get a warning about it being "Malicious Software" you can remedy this by going to your Mac System Preferences and choosing 'Security & Privacy' and under the General tab, check the "Open Anyway" option to allow it to open.

If you keep getting a warning when you try and open your local server instance and it says "The specified item could not be found in the keychain" you can remedy this by going to your application folder and opening the utilities folder and opening Keychain Access and right clicking on the MySQL access and adding it on.
